

STEERING & SUSPENSION

Manufactured exclusively in Europe, Motaquip's Steering and Suspension products deliver the responsive and balanced driving experience motorists demand.

Premium materials and finely tuned engineering processes are combined with rigorous testing to ensure only the finest parts make up our Steering and Suspension range.

From the moment raw materials are delivered we apply strict controls that continue through production. This means customers drive away with perfectly integrated parts that deliver responsive, balanced performance – even in the most demanding vehicles and conditions.

ENGINEERED TO LAST

Precision-cut bearings, superior lubricants, and harder-wearing contact materials ensure longevity and reliability.

Alloy plate is designed to be lightweight while offering high tensile strength.

Higher grade rubbers mean greater resistance against temperature, longer life and better protection from foreign particles.

Shock Control

Hardened alloys and precision engineered joints provide the tensile strength and balance necessary for even and effective shock distribution.

Corrosion Prevention

Superior core materials and lubricants mean greater resistance to the chemicals found in driving environments to prevent oxidation and corrosion.

Temperature Resistance

Rubber deteriorates quickly during summer, but the durability of Motaquip's raw materials means greater resistance and a longer life.

Debris Protection

Component dust covers are among the most vulnerable parts, so ours are made from premium materials to offer more protection from foreign particles.
